DETAILED ACTION

The amendment filed on 07/19/2010 has been entered.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 07/19/2010 has been entered.

Allowable Subject Matter

Claims 1-21 are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding independent 1, the prior art of record fails to teach or suggest a photomultiplier tube comprised of, in part, a regulating means for smoothing an equipotential surface in a space between the first dynode and the second dynode along a prescribed direction, wherein the potential regulating means including a first regulating element and a second regulating element that is separate from the first regulating element, the first regulating element being located between the first end face of the first dynode and the first end of the second dynode in a direction perpendicular to the prescribed direction and the second regulating element being located between the second end face of the first dynode and the second end of the second dynode in the direction perpendicular to the prescribed direction.

Art Unit: 2889

Ohmura et al., (US. Pat: 5, 616,987) teaches (in at least figs. 7-9; figs. 8 and 9 are enlarged view of fig. 7) a photomultiplier tube comprising: a vacuum chamber constructed from a substantially spherical light-receiving surface (1), a bulb portion (2), and a cylindrical stem portion (3) serving as a stand base; a photoelectric cathode (5) is formed on the inner surface of the light receiving surface (1); a plurality of dynodes (Dy1, Dy) multiplying electrons emitted from the cathode; each dynode extending in a prescribed direction (best seen in figs. 8 and 9; i.e. Dy1 and Dy both extend in a prescribed direction), the plurality of dynodes having a first dynode (Dy1) having an edge in the prescribed direction and a second dynode (Dy) having an edge in the prescribed direction (see at least figs. 8 and 9), the first dynode (Dy1) receiving electrons from the cathode (5) and multiplying the electrons and emitting the multiplied electrons, and the second dynode (Dy) receiving the electrons from the first dynode and multiplying the electrons and emitting the multiplied electrons; and potential regulating means (10; i.e. the plate electrode) disposed in a prescribed position (best seen in figs. 8 and 9), between the edge of the first dynode (Dy1) and the edge of the second dynode (Dy), and smoothing an equipotential surface (S) in a space between the first dynode (Dy1) and the second dynode (Dy) along the prescribed direction. However, Ohmura ('987) does not teach the regulating means includes a first regulating element and a second regulating element that is separate from the first regulating element, the first regulating element being located between the first end face of the first dynode and the first end of the second dynode in a direction perpendicular to the prescribed direction and the second regulating element being located between the second end face

Art Unit: 2889

of the first dynode and the second end of the second dynode in the direction perpendicular to the prescribed direction.

Due to their dependency, claims 2-21 are necessarily allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
